Lack of thermalization in lattice gauge theories

Titas Chanda, Jakub Zakrzewski, Maciej Lewenstein, Luca Tagliacozzo
Phys. Rev. Lett. 124, 180602 (2020)

Abelian QED 2

$$\begin{aligned} \hat{H} = & \sum_j \hat{L}_j^2 + 2 \left(x \left((m/q)^2 + 2x \right) \right)^{1/2} \sum_j (\hat{a}_j^\dagger \hat{a}_j + \hat{b}_j \hat{b}_j^\dagger) \\ & - \frac{x^{3/2}}{\left((m/q)^2 + 2x \right)^{1/2}} \sum_j \left[(\hat{a}_{j+1}^\dagger + \hat{b}_{j+1}) \hat{U}_j (\hat{a}_j + \hat{b}_j^\dagger) + \text{h.c.} \right], \end{aligned} \quad (1)$$

- Positive charge
(more particles)
 - Negative charge
(more antiparticles)
- Positive electric field
- Negative electric field

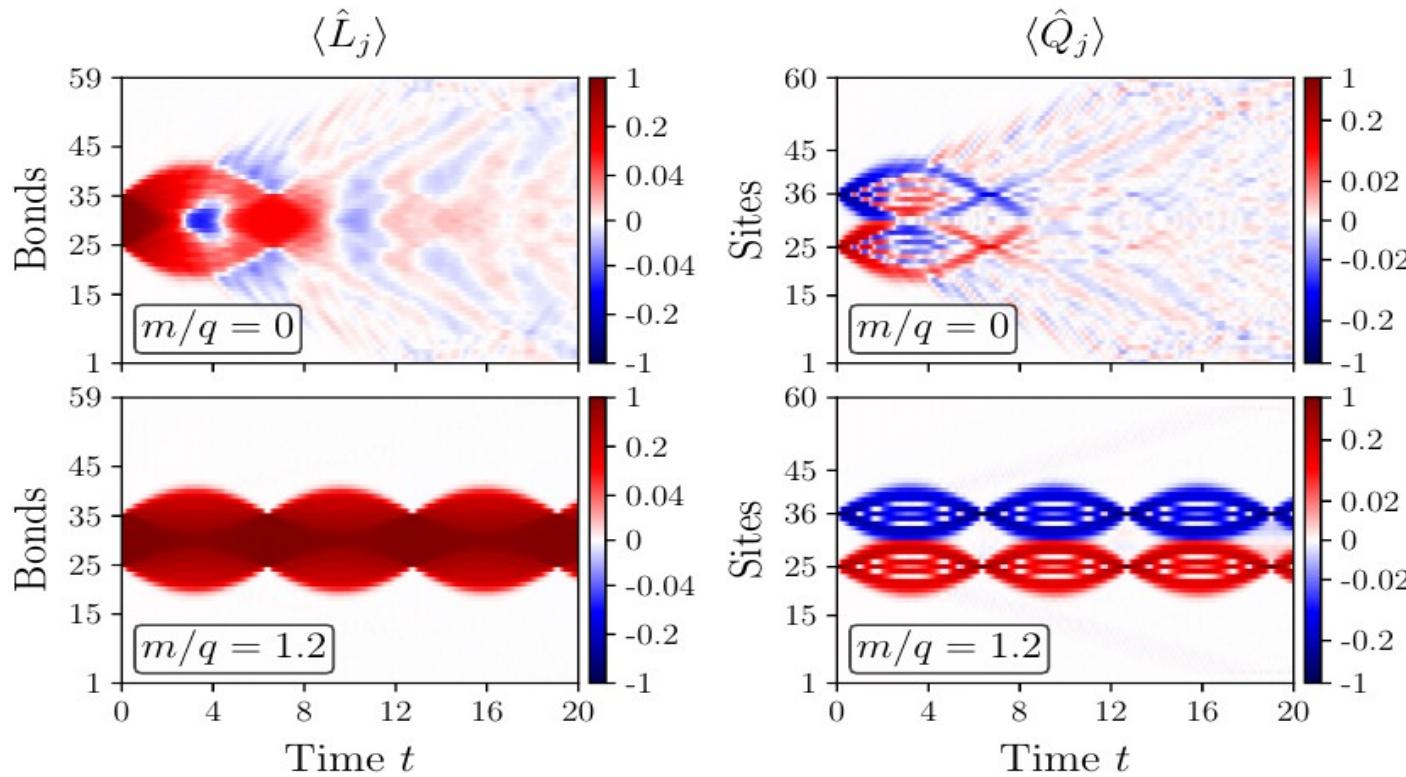

Quench protocol

- We obtain the ground state of H with MPS
- Act with the operator

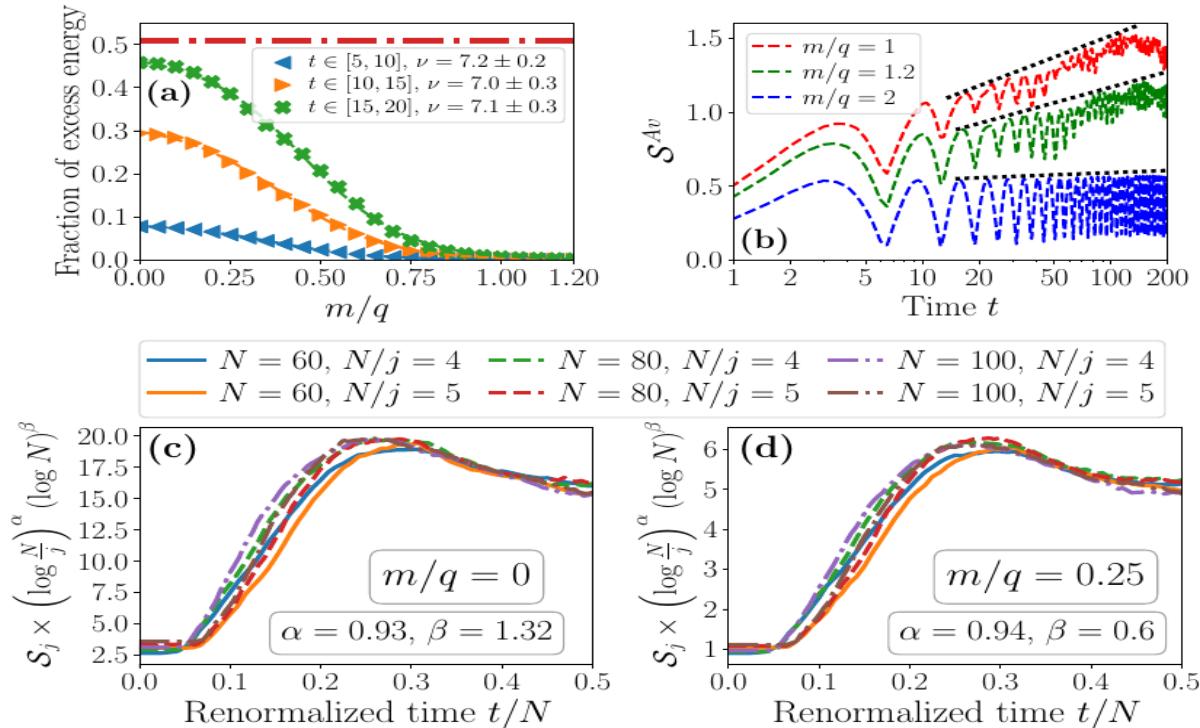

$$\hat{M}_R \equiv \left(\hat{a}_{\frac{N}{2}-R}^\dagger + \hat{b}_{\frac{N}{2}-R}^\dagger \right) \left[\prod_{j=\frac{N}{2}-R}^{\frac{N}{2}+R} \hat{U}_j^\dagger \right] \left(\hat{a}_{\frac{N}{2}+R+1} + \hat{b}_{\frac{N}{2}+R+1}^\dagger \right)$$

Robust Z2 deconfined phase

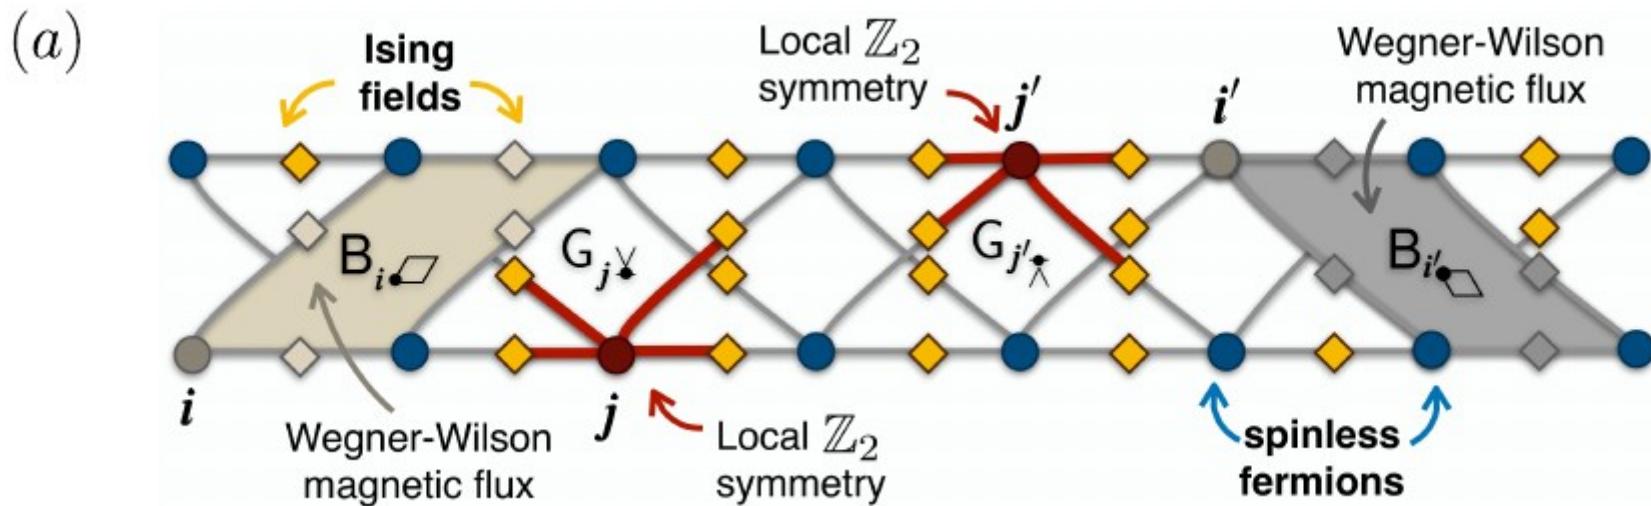

arXiv:2002.06013

Daniel González-Cuadra, Luca Tagliacozzo, Maciej Lewenstein, Alejandro Bermudez

Ladder

- Fermions coupled to Z2 gauge fields

$$\mathcal{H}_{\text{CI}}(t, \Delta, h) = \sum_{\mathbf{i}} \sum_{(\mathbf{i}, \mathbf{j})} \left(-t c_{\mathbf{i}}^\dagger \sigma_{(\mathbf{i}, \mathbf{j})}^z c_{\mathbf{j}} - h \sigma_{(\mathbf{i}, \mathbf{j})}^x \right) + \frac{\Delta}{2} \sum_{\mathbf{i}} s_{\mathbf{i}} c_{\mathbf{i}}^\dagger c_{\mathbf{i}},$$

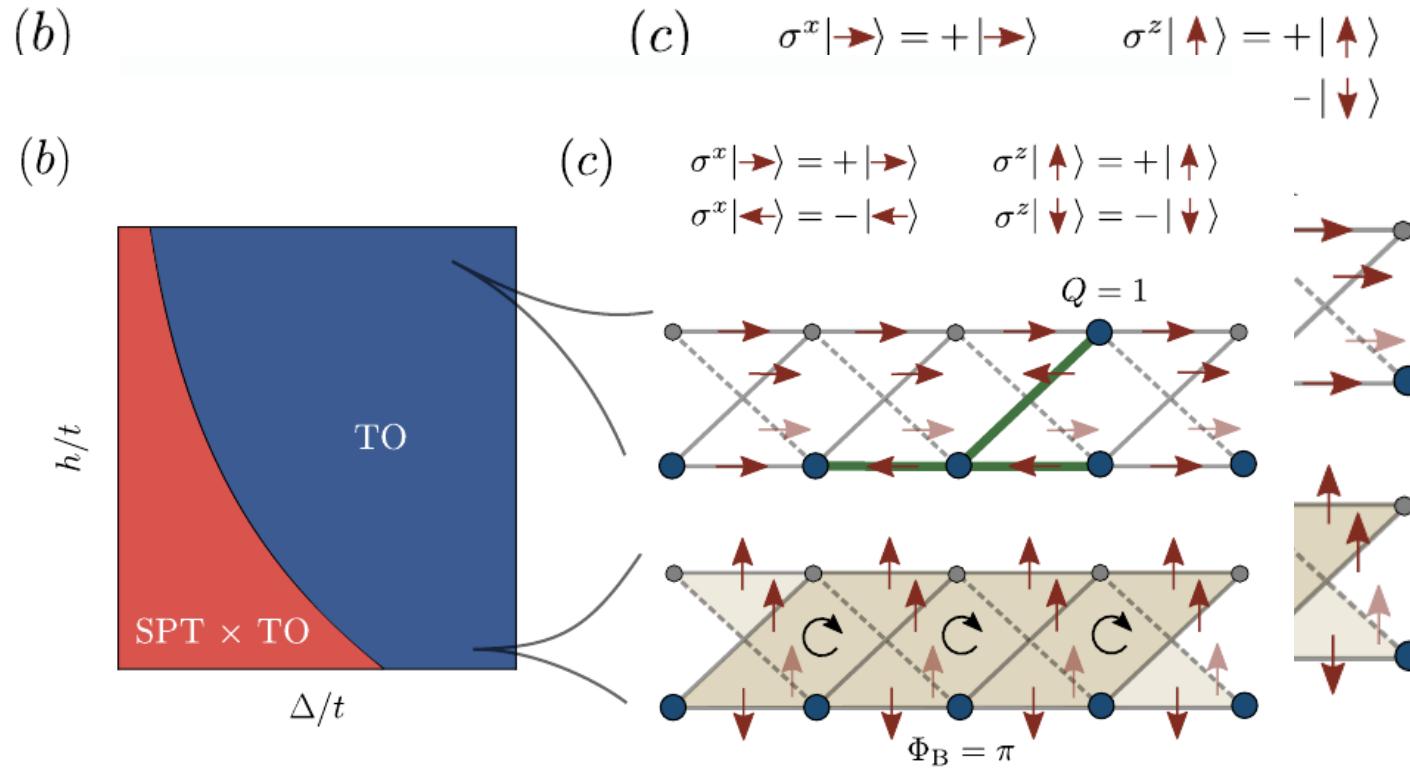

Gauge constraints

$$G_{i\vee} = (-1)^{c_i^\dagger c_i} \prod_{(i,j) \in i\vee} \sigma_{(i,j)}^x, \quad G_{i\wedge} = (-1)^{c_i^\dagger c_i} \prod_{(i,j) \in i\wedge} \sigma_{(i,j)}^x,$$

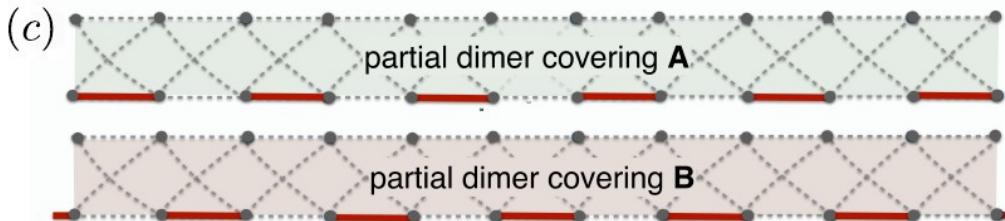

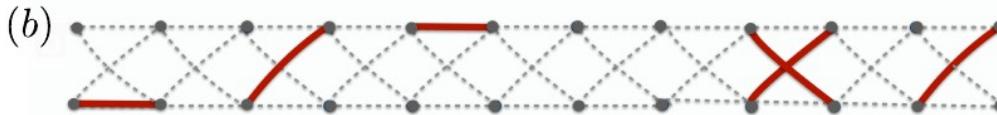

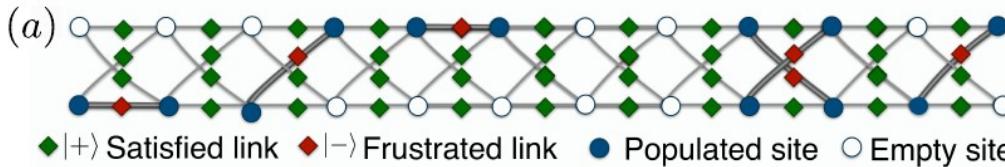

And we define gauge sectors,

$$G_i |\psi\rangle = (-1)^{q_i} |\psi\rangle,$$

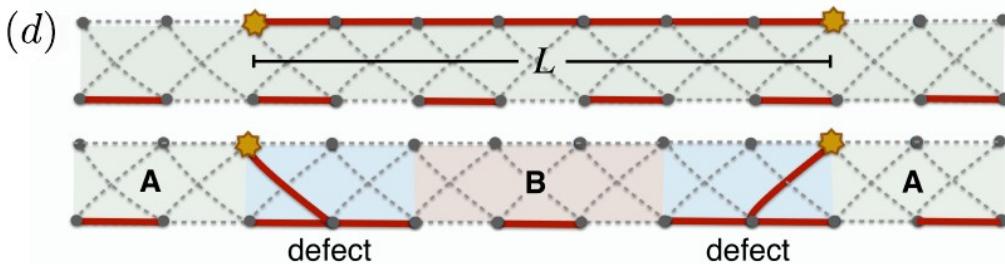

Phase diagram

Soliton induced deconfinement

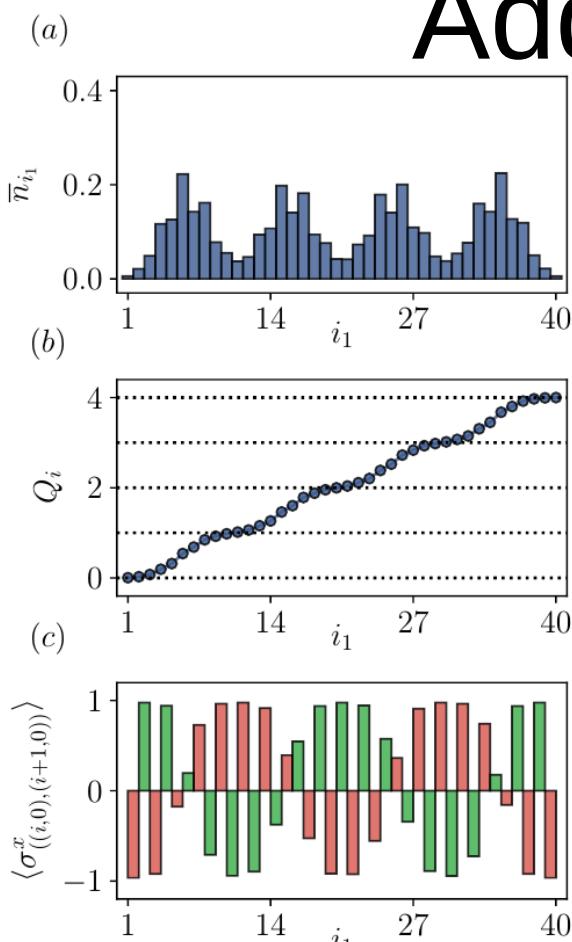

$h \gg t, J$ and $\Delta = 0$ limit

$\Delta > 0$

Adding 4 fermions

- The extra occupation
- The electric field
- The integrated extra charge

$N = 44$ particles for $\Delta = 4t$, $h = 0.2t$ and $J = 0$,
